

Multi-site Disease Control with nutritional benefits for Winter Wheat

Summary

Laminator is an ideal multi-site treatment at T1 in wheat for this year's diseases.

This year, the foliar disease risks are not just Septoria, but also yellow rust and in some cases, mildew. (ADAS Crop Notes 22nd April 2010)

The T1 timing fungicide treatment in wheat needs to deliver effective broad-spectrum disease protection and also a multi-site mode of action to manage the question of resistance management.

Laminator does just that.

Containing 455 g/L mancozeb (*the world's best-selling multi-site fungicide*) in a flowable formulation, **Laminator** delivers excellent protection against Septoria but also mildew, yellow and brown rust.

- Against Septoria, 1.5L/ha **Laminator** is equivalent to 1L/ha chlorothalonil.
- **Laminator** does not interfere with the uptake and action of other fungicides used in a tank mix.

Laminator also provides nutritional benefits.

Crops this spring have had a tough winter and in many cases are now drought stressed at a critical time when the ears are trying to maintain grain sites. Additional manganese in the foliar fungicide programme can be a big plus. At 1.5L/ha Laminator delivers 140g/ha of nutritionally available manganese, making leaves **greener**, leading to improved photosynthesis (mancozeb contains 20% w/w manganese and 0.2% zinc).

Flexible – **Laminator** can be used throughout the programme from T0 to T3.

- A standard dose of 1.5L/ha can be used repeatedly throughout the programme up to grain watery ripe stage (GS73). The maximum total crop dose is 9.9L/ha.
- Tank Mixing – **Laminator** can be mixed with a wide range of other relevant products.

Multi-site – **Laminator** contains 455g/L mancozeb with no resistance concerns.

- Rated in the HGCA's wheat disease management guide as suitable for resistance management, Laminator continues to provide consistent multi-site protection.
- Highly suitable for wheat growers in the battle against Septoria.
